

## **Attachments, Overdentures & Implants: Repeatable 1-hr Table Demo Workshop**

**Suggested Audience:** Dentists, Lab Technicians and Dental Auxiliaries

Participants choose the attachments they would like to learn about and attend separate one hour lectures.

### **Course Description:**

The attachment retained overdenture provides comfort, stability and retention beyond the limits of the traditional overdenture.

Each hour, a different attachment is used to demonstrate the simplicity of the direct overdenture technique. An attachment is cemented into a root on a typodont model and its corresponding male or female is picked up in a self-curing acrylic. All aspects of the specific attachment are presented as well as a discussion of the rationale for using attachments in dentistry. Overdenture fabrication technique is discussed as well as space evaluation, requirements and relining. All participants will observe

- Preparation of the root to accept an attachment
- Cementation of the attachment into a root
- Block out techniques
- Direct pick-up of the corresponding male or female in the denture
- Relining techniques

### **Course Objectives:**

**Upon successful completion of this course, attendees will:**

- Learn all about one specific overdenture attachment system
- Pick and choose which attachment they would like to work with
- Learn as much as possible in a short period of time with a limited audience
- Gain a new level of knowledge, confidence and enthusiasm that can be used immediately
